

Firm-level Effects of the Minimum Wages

31th ERF Conference — April 29, 2025

Motivation

- Minimum Wage as a Policy Tool
 - Widely used as a government intervention to protect low-wage workers.
 - Impact on labor markets and firms has been a key area of debate in economics.
 - Previous studies have focused on employment effects, but there is less consensus on the broader firm-level impacts, especially on prices.

- Aim of this paper is to investigate the effect of minimum wage increase in 2016 on firm level outcomes in Turkish manufacturing.
- We focus on prices, profit rate, employment, sales and production.

Contribution

- There are some evidence documenting the firm level effects of minimum wage shock for developed countries (Lemos, 2008, Draca et al, 2011; Cengiz et. al, 2019; Ashenfelter and Jurajda, 2022; Link, 2022; Agarwal et. al, 2024)
- This study is a first attempt to provide causal response of firms when they face a labor cost shock in a developing country context.
- We also take account the market concentration of industries firms operate.
- We cover all product bundles of firms. Few studies had such granular data. We measure unit prices (sales/quantity).

Turkey's Unique Context (2016)

- In January 2016, Turkey implemented a 33.5% increase in the minimum wage—a significant and sudden policy shift.
- The share of minimum workers is around 40%.
- The large-scale shock provides a natural experiment to study how firms adjusted in response, beyond just employment.

Identification -firm-product level data

Product-level estimation where, f , p , and t represent firms, products, and time respectively,

$$\Delta \log(\text{price}_{fpt}) = \alpha + \beta \text{exposure}_f \times D_{\text{year} > 2015} + D_f + D_t + D_{fp} + D_{pt} + D_{kt} + D_{rt} + \varepsilon_{fpt}$$

- exposure: 1) share of minimum wage earners to total earners in 2015, 2) the ratio of the sum of daily wages below the 2016 daily minimum wage to the gross wage bill for each firm.
- firm, time, product x firm, product x time, sector x time and region x time fixed effects.
- We also calculate the quality adjusted prices following Khaldelwal et al. (2013).

Identification -firm level data

Firm-level estimations

$$y_{ft} = \alpha + \beta \text{exposure}_f \times D_{\text{year} > 2015} + D_f + D_t + D_{kt} + D_{rt} + \varepsilon_{fpt}$$

where y_{ft} is log weighted unit prices, log sales, log production value, log employment, and profit rate. Prices at the firm level are calculated as a weighted average where weights are the sales share of each product produced by firm.

Firm, time, sector x time and region x time fixed effects.

We utilize three administrative and one survey dataset provided by TurkStat from 2009 to 2019. Common firm identifier allows us to merge four of them.

1. PRODCOM survey provides information on sales, quantity, production value for 10 digit products of firms with 20 and above employees in manufacturing and mining industry.
2. Employer-employee dataset by Social Security Institute (SSI) have information on workdays, wage, occupation and firm employed on monthly basis for each firm from.
3. Balance-sheet dataset by Ministry of Treasure and Finance gives us the data of all firms' sales, liabilities, profits etc.
4. Trade dataset to identify the firm-product exporter pairs
5. Finally, we obtain industry and province information of firms using Industry and Service Statistics dataset by TurkStat.

- We focus on manufacturing industry firms with 20 and more employees.
- We restricted the firms active in 2015.
- We have 30,215 firms in sample for the period between 2009 and 2019

Results -firm-product level sample, price model

Conclusion

- We find a positive effect of the minimum wage increase on prices in Turkish manufacturing (1 percentage point increase in labor cost leads to 0.12 percentage increase in prices.)
- Positive effect is also evident in weighted firm-level prices
- Firms in less competitive industries are more likely to reflect this labor cost shock to their prices.
- Minimum wage shock also affect the other firm outcomes (sales, production, employment and profits) negatively.
